About this book

Signals Under Pressure examines politically motivated cyber attacks against information infrastructure in China and the public policies developed in response. It distinguishes disruptive attacks intended to intimidate institutions from ordinary computer crime and technical system failure.

The book also studies government control of Internet access and online expression. Case studies consider website blocking, platform regulation, public communication during network disruptions, and the relationship between Internet censorship and national security policy in China.

The analysis draws on public policy documents, interviews with network administrators, and comparative studies of digital resilience. It does not provide operational instructions for conducting attacks.
